

Design both simple and very complex projects with almost equal ease.

The Segmented Project Planner helps you design and construct better projects by performing all the calculations necessary to bring your design idea to reality. It will do it much more easily and faster than you can by hand. And, it doesn't make mistakes. It will keep you from cutting segments the wrong size. All this helps you concentrate on the fun part; turning a piece of wood into a pleasing form.

# Segmented Project Planner

Segmented Project Design  
Made Easy and Accurate

## Segmented Project Planner Features

- Supports frame miter, stave, **and** compound miter rings.
- Use a simple starter shape to create your own vessel shape in 5 minutes. Use completed projects to make new starter shapes to use in future projects. Use the mouse to draw projects. Use Design Assistant for better, faster shape design.
- Layer Tuner provides large-view drag-to-change with real-time view update to make the design process easier and more intuitive.
- AutoBowl function automatically translates outer bowl dimensions into layer diameters and segment widths to make design even easier than before.
- Create zigzag, diamond, open segment, or vertical spacer designs to incorporate in your projects.
- Registered users get free upgrades.
- Supports Ring Master projects.
- Calculate side incline angles for compound miter or Ring Master situations.
- Intelligent layer insertion anticipates your next layer size.
- Create documentation for your project, complete with pictures, so you won't forget how you did it or what happened along the way.
- Print full ring and/or segment templates to support open segment glue-ups and segment size checking.
- Gallery View makes it easier to identify prior projects to work next.
- Paint any segment with a solid color, mosaic design, or image.
- Resize your project just like a photograph.
- Displays projects with staggered/half-lap, vertical or layer variable stagger segment alignment.
- Copy Layers function quickly copies selected layer input parameters down through one or more layers for faster design.
- Export files are created to use project data in other documents.
- Includes free plans you can use/modify for your own projects.
- Seven levels of zoom let you get really close and personal with the details of your project.
- Display resizes to entire screen so you don't have to squint to see project.
- Calculates segment-cutting dimensions for any size ring with any number of sides so it won't limit what you can plan.
- Calculates segment dimensions that take your personal accuracy into account so you don't have to worry about adding fudge factors.
- Calculates the size of board needed to make each ring so you don't have to buy/cut more wood than you need.
- Calculates board length to support either economy or grain matching cutting methods.
- Displays top and side views of your project so you can see what's going on at every step of your design.
- Displays overview or detail side views so you can use it to design the entire project. Side view includes wall placement in each layer.
- Displays minimum wall thickness for the project so you can avoid walls that are too thin.
- Supports English/Imperial (inches) and Metric (millimeters) units with automatic project conversion between chosen units.
- Enter dimensions in inches (e.g. 10-1/2 or 10.5) or choose millimeters.
- A project can have as many layers as desired so you won't be limited.
- Prints full project specifics along with top & side views to a Windows compatible printer so you can take the output straight to the shop.
- Extensive context sensitive help and on-line user manual so all questions are quickly answered.
